

List of Objects

D2000 VBApi - Getting the list of objects

Object selection (during the application implementation via the interface [D2000 VBApi](#)) is able from the selection window opened by calling the procedure **VBApiGetObjectName**.

Declaration

```
Declare Sub VBApiGetObjectName Lib "vbapi.dll" Alias "_GetObjectName@8"  
(ByRef name As String, ByRef ok As Long)
```

Parameters

name	Name of selected object.
ok	Return value - call success.

Return value

Value of the parameter *ok*.

Return value	Description
0	Calling successful. If the user selects no object, the parameter <i>name</i> will be a null string.
2	No logon user.
3	Internal error.

The functionality and appearance of the selection window is the identical with [selection window](#) in the processes [D2000 HI](#) and [D2000 GrEditor](#).
