

# TailStr (RightStr)

## %TailStr (%RightStr) function

### Function

The function returns a specified number of rightmost characters from a string.

### Declaration

```
TEXT %TailStr(  
    TEXT in string,  
    INT in length  
)
```

```
TEXT %RightStr(  
    TEXT in string,  
    INT in length  
)
```

### Parameters

<b>string</b>	The text string that function returns characters from.
<b>length</b>	The number of characters returned from the text string.

### Note

If the string is longer than the number defined in the parameter *length*, the function returns as many last characters as specified by the parameter *length*.

If the string is shorter than the number defined in the parameter *length*, spaces are added to the result string according to the number specified by the parameter *length*.
