

TailStr (RightStr)

%TailStr (%RightStr) function

Function	The function returns a specified number of rightmost characters from a string.				
Declaration	TEXT %TailStr(TEXT in string, INT in length) TEXT %RightStr(TEXT in string, INT in length)				
Parameters	<table><tr><td>string</td><td>The text string that function returns characters from.</td></tr><tr><td>length</td><td>The number of characters returned from the text string.</td></tr></table>	string	The text string that function returns characters from.	length	The number of characters returned from the text string.
string	The text string that function returns characters from.				
length	The number of characters returned from the text string.				
Note	If the string is longer than the number defined in the parameter <i>length</i>, the function returns as many last characters as specified by the parameter <i>length</i>. If the string is shorter than the number defined in the parameter <i>length</i>, spaces are added to the result string according to the number specified by the parameter <i>length</i>.
