

JSON_ObjectGetFieldName

%JSON_ObjectGetFieldName function

Function Gets a field name at a given index from the JSON object.

Declaration

```
TEXT %JSON_ObjectGetFieldName(  
    INT in handle,  
    INT in index  
)
```

Parameters

handle	Handle to parent JSON object.
index	Index of field

Return value Field name at a given index in the JSON object.

Description Function gets a field name at a given index in the JSON object.

Exception is thrown if handle to the JSON object is invalid or index is out of range.

Example

```
INT _obj  
_obj := %JSON_ObjectFromString('{"Text":"Lorem Ipsum"}')  
  
TEXT _txt  
_txt := %JSON_ObjectGetFieldName(_obj, 1)  
  
%JSON_FreeObjectHandle(_obj)
```
