

Avex

%AvexR function

Old name	%AvexR				
Function	The function returns the time-weighted average of the values within an elapsed time period. The expression, that contains this function, must be evaluated on a change. The result is a real value. Note: Unlike the Ave function that publishes the preliminary average continuously (after each evaluation), the Avex publishes the result only when ResetTrigger=@TRUE.				
Declaration	<pre>REAL %Avex(REAL in Arg, BOOL in ResetTrigger)</pre>				
<hr/>					
Parameters	<table><thead><tr><th>Arg</th><th>Variable, which average is to be calculated.</th></tr></thead><tbody><tr><td>ResetTrigger</td><td>Change of the parameter into @TRUE state resets the average.</td></tr></tbody></table>	Arg	Variable, which average is to be calculated.	ResetTrigger	Change of the parameter into @TRUE state resets the average.
Arg	Variable, which average is to be calculated.				
ResetTrigger	Change of the parameter into @TRUE state resets the average.
